ABSTRACT

PURPOSE: To enable an explainer to change an image without leaving a display screen by providing a part of a computer control input means to a pointing device held by the explainer together with a detection means which detects the position pointed by the pointing means in regard of the image shown on a display device.

CONSTITUTION: An explainer points a necessary part of an image shown on a display means 7 with a pointing means held by the hand of the explainer. Then a position detection means 11 detects the position pointed by the pointing means. A control means 3 gives a necessary change to the image at the pointed part or switches an entire screen based on the detection result of the means 11 or the input applied to a control input means 12. As a result, the explainer can change the necessary part of an image without leaving the displayed image.
